

Integration: Billing Systems Update

Purpose

Customer master data, meter data and consumption changes from the billing systems are needed in the Pricing Tool to ensure the offers and pricing are based on the latest information

Details include but are not limited to items like Customer name, address, CVR number, POD, POD address and consumption.

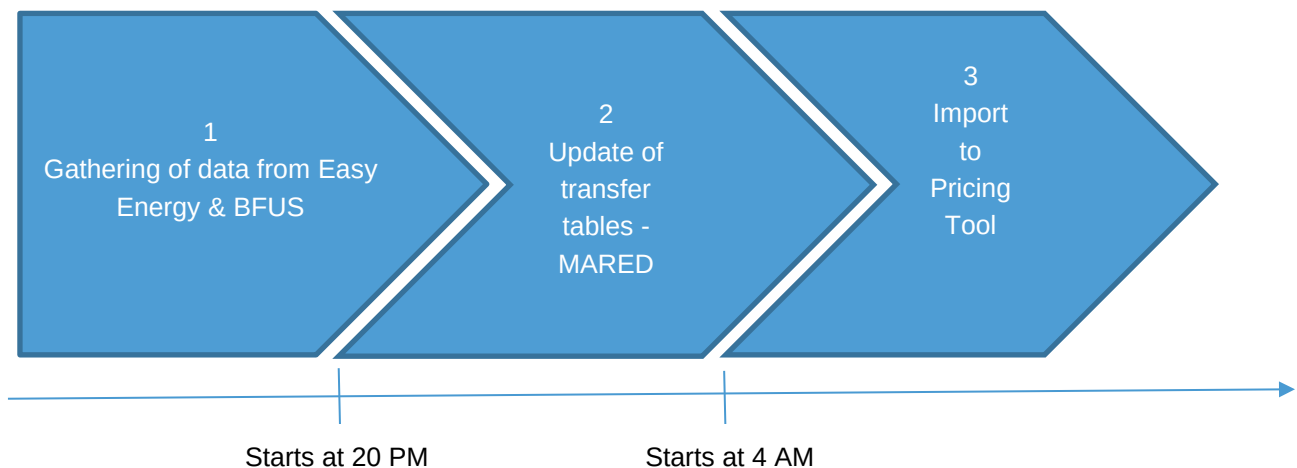

Power consumption is hourly

Gas consumption is hourly if it is an hourly meter but all Gas meters have the expected annual consumption

Method

Automated processes take data from the 2 billing systems (Easy Energy & BFUS) and store it in an on-premise SQL server database called MARED which is used for some internal Orsted MI reporting purposes so will probably remain.

The load for the Pricing Tool goes through the following 3 stages:

Currently the data is transferred by direct SQL server update since all servers are on premise
For this data transfer to the new Pricing Tool the transfer will need to be done in a secure way using a methods approved by Orsted Security – see Non Functional Requirements

Data Flow

In MARED the data changed or added has the last updated timestamp changed so then only items changed today need to be sent to the Pricing Tool

Data is sent daily at 4 am

If the Pricing Tool will not handle zero consumption values in the profiles then Orsted can check for missing data and adjust it

If POD's containing only 0 values throughout a month are a problem then Orsted can update these with one hourly value of 1 kWh per month

In addition to straight forward updates of existing customer details or creation of a new customer with all related data, here are some scenarios which need to be handled:

1. Addition of PODs to a customer
2. Removal of PODs from a customer
3. Change of Payer information for a customer
4. Update of meter details
5. Update of consumption

Suggested sequence of actions:

1. Load customers
2. Load customer hierarchy
3. Loading of installation sites
4. Load customer meter table.
5. Removing deleted references
6. Load alternative payer
7. Load usage data
